

Pozivamo vas da se okupite u prostorima Logopedskog centra, Udbinska 16 (ulaz i iz Zvonigradske, pored Doma zdravlja Nehajska) 28. rujna 2009. u 20 sati.

Tada će nas Jelena Tadić, jedna od mlađih logopedskih snaga Zavoda za psihofiziološke poremećaje i govornu patologiju "Prof. dr. Cvjetko Brajović" iz Beograda, izvijestiti o metodi Svjesna sinteza razvoja kakva se danas primjenjuje u toj instituciji te o radu njihovog Društva osoba koje mucaju.

Dr Weidig će nam izložiti svoja razmišljanja koja je prije dva tjedna prezentirao na konferenciji British Stammering Association u Londonu:

Neurobiological versus Psychological: How does it all fit together?

Recent brain imaging and genetics research strongly suggest a neurobiological basis for stuttering. But how does a neurobiological basis explain the behaviours and experiences of people who stutter? Why are most stutterers able to speak completely fluent alone and in some situations but not in front of others, for example their boss? Why are stutterers fluent during singing, acting, or imitating a French accent? Why do some stutter on the letter d and others on the letter s? How can stuttering be neurological because people who stutter are able to speak fluently? Why are stutterers fluent after therapy but relapse later? I will present a simple conceptual model of the neurobiological basis, and propose a biopsychosocial framework within which all behaviours and experiences can be explained in principle.

Tom je inače vlasnik i urednik poznatog i cijenjenog bloga [The Stuttering Brain](#) .

Pozivamo vas da dođete i saznate više o njemu i njegovim razmišljanjima.
